

Kinetic Jump Presents...

AppLife™ Update

Automatic Updating Solution

Create, Publish, Download, Apply

PEACE OF MIND

Be assured that your software is secure because AppLife™ Update signs each update with your own private key. Only after successful validation will your update be applied.

SIMPLE, YET POWERFUL

You can update your software with a single line of code. You can also create very custom update processes and use our software to do all of the heavy lifting.

NO SPECIAL SERVERS

Host AppLife Updates from any file server. Use Http, Ftp, UNC, or file shares to serve your updates.

AppLife™ Update

- Create & Publish**
Quickly create updates for your .Net applications.
- Discover & Download**
Integrate automatic updating features directly into your application source code.
- Validate & Apply**
Every downloaded update is validated to ensure integrity and source before being executed.

Users today expect applications to provide them the ability to easily keep their software up-to-date. With today's technology and ubiquitous high speed networks, even the most complicated applications can successfully deploy new features and code fixes without expecting their users to manually download and reinstall their software. AppLife™ Update makes implementing automatic updating quick and simple. With ready-to-use actions that perform the most common updating activities and a powerful custom action architecture that allows you to quickly create actions to perform any specialized updating tasks, you can integrate these features into your application in a fraction of the time it would take you roll your own. AppLife™ Update accomplishes all of the challenges of updating software for you. Challenges such as allowing standard users to update their software without admin support, closing all instances of the application before updating, automatically detecting proxy server settings, etc.

Creating and publishing updates using AppLife™ Update couldn't be easier. Create your update project using the AppLife™ Make Update application, then build and publish updates as your software changes. You can even use the AppLife™ Update command line utility to integrate update publishing into your automated build process or directly into the Visual Studio build process.

AppLife™ Update is easy to learn and implement. With a fully documented application program interface (API), three Quick Start example applications and fanatical customer support, you will quickly be on your way to automatic updating in your application.

ROYALTY FREE

Freely distribute our Update Controller component with your software.

SIMPLE LICENSING

AppLife Update is licensed per user. Install the update making software on as many different computers as necessary for you, the licensed user, to do your job.

NO RISK TRIAL

Try AppLife Update for thirty days before you buy. Our trial software *is* our software. We do not cripple our trial software in any way.

SITE LICENSE

You can purchase a site license, allowing all of your developers to build and distribute updates. When compared to the cost of building your own update system, a site license is a very sound financial decision.

Features and Benefits

Integrate automatic update features into your .NET applications in mere minutes. Build and publish software updates as your application is modified. Here are a few of the features of AppLife™ Update:

- Replace files, register COM assemblies, edit config and Xml files using ready-to-use update actions
- Use the Windows Installer to update your software and AppLife™ Update for simple automatic deployment
- No administrative rights required to update using AppLife™ Update actions
- Integrate special tasks such as license validation and data saving into the update process through event handling
- Public-Private key cryptographic update validation
- Automatic proxy detection
- Extremely simple custom action infrastructure
- Fine control over update versioning
- Fully transacted and logged updates
- Controlled rollout features
- Flexible integration API, with synchronous and asynchronous methods to check for, download and apply updates

System Requirements

Client Software Requirements

- Microsoft .NET Framework 2.0
- Windows 2000, XP, Vista

Server Requirements:

- Any file server share that can be accessed through a file or UNC path
OR
- Any Http web server
OR
- Any Ftp server

Development System

- PC with Pentium II 500 MHz or greater processor
- 256 MB RAM Minimum
- 25 MB Hard Disk space.
- Windows 2000, XP, Vista
- .NET Framework 2.0
- Visual Studio 2005 or the Microsoft Software Development SDK
